Samantha Kellow

Design Engineer · London, UK · hello@sammii.dev · +44 7454 267667
Portfolio: sammii.dev · github.com/sammii-hk · linkedin.com/in/sammii

SUMMARY

Design engineer who builds the interfaces I design: component libraries, design systems and the products built on them. At Garden Computing I built the component library from scratch; at ASOS I worked on shared components, typography and accessibility. I now design, build and run Lunary, my own live subscription product.

EXPERIENCE

Product Engineer (independent), Lunar Computing, Inc

Jan 2026 - Present · TypeScript, Next.js, SwiftUI, Python, PostgreSQL, MCP

- Design and build a portfolio of web products, native iOS apps, developer tools and games, including Lunary, Nocturne and Saer.
- Build and run Lunary end to end: a live subscription app with paying subscribers, real-time astronomical calculation, Stripe billing and native widgets.
- Built Orbit, an agent pipeline of 14 agents across 21 scheduled jobs with checkpoint and resume, and per-agent cost tracking.

Founding Design Engineer, Garden Computing

Apr 2025 - Jun 2026 · React, TypeScript, Component Libraries, Design Systems, Figma, Claude API

- Built a component library and design system from scratch: shared primitives, design tokens, and a Radix-based headless component layer.
- Applied an external brand's design guidelines to a co-branded campaign asset (Vercel), getting sign-off first attempt: strong instinct for working within and adapting to an established visual identity.
- Operated across design and engineering simultaneously, owning brand, marketing, and component architecture in a team where these would typically be split across multiple hires.

Senior Front-End Engineer, bots

Sep 2024 - Apr 2025 · React, TypeScript, DataDog, Highcharts, LaunchDarkly

- Designed and built the product's search and analytics layers in collaboration with founders.
- Built data-driven dashboards and interactive reporting tools used by leadership and customers.
- Led feature development from concept to launch, managing scope and delivery.

Web Engineer, ASOS

May 2022 - Sep 2024 · React, TypeScript, Storybook, Kubernetes, AKS, TeamCity

- Built date-based automated event theming that removed the need for over 15 manual releases a year.
- Built reusable components for the shared component library, and rewrote the typography package to be DRY and delivered to every micro-frontend through the site chrome wrapper, with selective imports so each page loads only the fonts, characters and CSS it needs.
- Championed accessibility: aria labels for typographic imagery, a screen-reader-correct heading hierarchy in the MiniBag, accessible focus styles, and Cypress tests for accessible accordion behaviour.

Full-Stack Engineer, Rare: Group

Mar 2020 - Apr 2022 · Vue, JavaScript, TypeScript, SQL, Jest

- Built an atomic design system of reusable Vue components as part of a company rebrand, bringing a consistent look and UX across products.
- Led UI for data-visualisation apps, improving usability and the insight people could pull from the data.
- Delivered a back-end project using test-driven development, picking up new technologies for the task.

SELECTED PROJECTS

Saer: Python, MCP, CSS analysis
Built Saer: CLI that scans an existing frontend codebase and infers the design system that actually exists (colour, spacing and type scales, near-duplicate values, missing roles), then exposes it to AI coding agents through a read-only MCP server so they build with the real system. 283 tests, deterministic across Python 3.10 to 3.14, checked against 23 real repos. Private beta.

Prism: Next.js, TypeScript, React Three Fiber, CSS Custom Properties, Playwright, Claude API
Built Prism: Component library focused on interaction quality and visual depth. Inputs and buttons track cursor position via JS mousemove, feeding x/y coordinates as CSS custom properties that drive border colour and glow, with no animation library. Includes MagneticButton, SpotlightCard and an interactive playground (colour-field, fluid-mesh, text-dissolve, gravity-wells, shader-marbling). Built to production component standard with typed APIs and progressive complexity. Agents handle discrete parts of the pipeline (scouting UI trends, drafting a component, producing a demo) and I review every output before anything ships. (https://prism.sammii.dev)

SKILLS

Front-end: React, Next.js, TypeScript, TailwindCSS, Storybook, Zustand, Vercel, accessibility, performance

Design systems and DX: Component libraries, Design tokens, Accessibility, Documentation, Shadcn, Radix UI, CLI tooling

Creative technology: D3.js, Three.js, MapBox GL, WebGL, GLSL, React Three Fiber, GSAP, Framer Motion, Rapier2D, Matter.js, p5.js

AI and agents: Claude API, MCP servers, Vercel AI SDK, multi-agent pipelines, Playwright

Back-end and tooling: Node.js, REST APIs, Prisma, PostgreSQL, Vite, Cypress, Jest, GitHub Actions, Docker, Kubernetes

EDUCATION

MA Visual Communication (Merit), 2017 · BA Graphic Design (First Class Honours), 2016 · Solent University
